

# The Magnetic Field Suggests a Young Earth

Recently CTV News reported that the magnetic field is weakening between South America and Africa. So far this has only caused satellites some problems.

The magnetic field protects earth from the sun's cosmic rays. Scientists say the magnetic field has weakened about 5% each century since it was discovered in 1845.

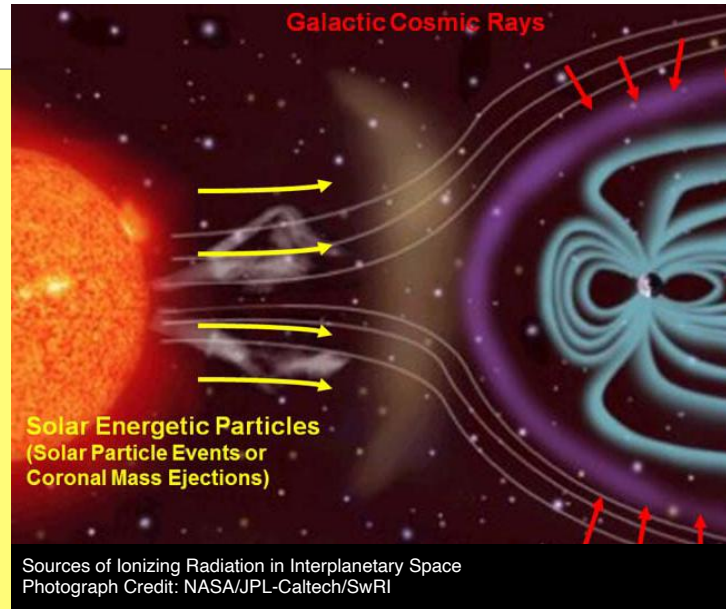

If this figure is calculated backwards, the age of earth could not be older than 10,000 years. Why? The magnetic field

would be too strong for life to

begin on earth (in fact, the hospital staff need to be protected from *electromagnetic* fields that the MRI equipment gives off.)

Is this scientifically valid? To find out the answer, you are invited to view Deaf Genesis Apologetics' **ASL presentation** at:
