

Species or Kinds Can Change, but...

One of the important "proofs" of evolution is that life evolved *from species to species*. We often see illustrations of fish *evolving into* amphibians *and* amphibians *into* dinosaurs. Yet, fossil records do not show this. There is no evidence of *transitional changes* from one species into another. Scientists admit this. Did you know this?

When different dogs breed together, we get dogs different from their parents. When different cats breed, we see the same thing. Change can happen *within a kind*, but there is no record of *one kind changing to another kind*.

You are invited to learn about this subject in an ASL presentation by Deaf Genesis Apologetics at:

<https://www.youtube.com/watch?v=Uk1AZDtIldU>
